Available**

Get years of battery life while taking advantage of existing Wi-Fi access points to deliver low cost, reliable and secure wireless sensor network products.

By sleeping while maintaining access point association, RFM WSN802G modules wake up periodically, or on interrupts and automatically transmit sensor data in mere milliseconds. The result: a low cost sensor network that can run for years on a battery, without needing gateways.

With the routines built-in to the module, plus the analog and I/O, no other processor is needed to implement a versatile, easy-to-use wireless sensor.
